

Industry Best Practices for Human-Polar Bear Conflict Reduction on Alaska's North Slope

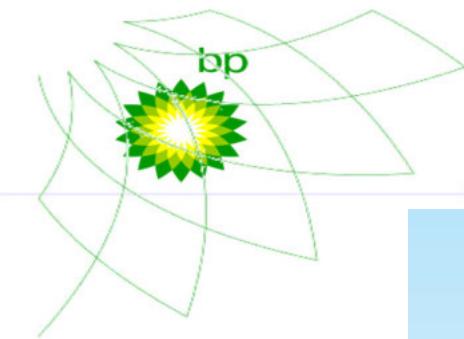

Christina Pohl

BP Exploration (Alaska), Inc.

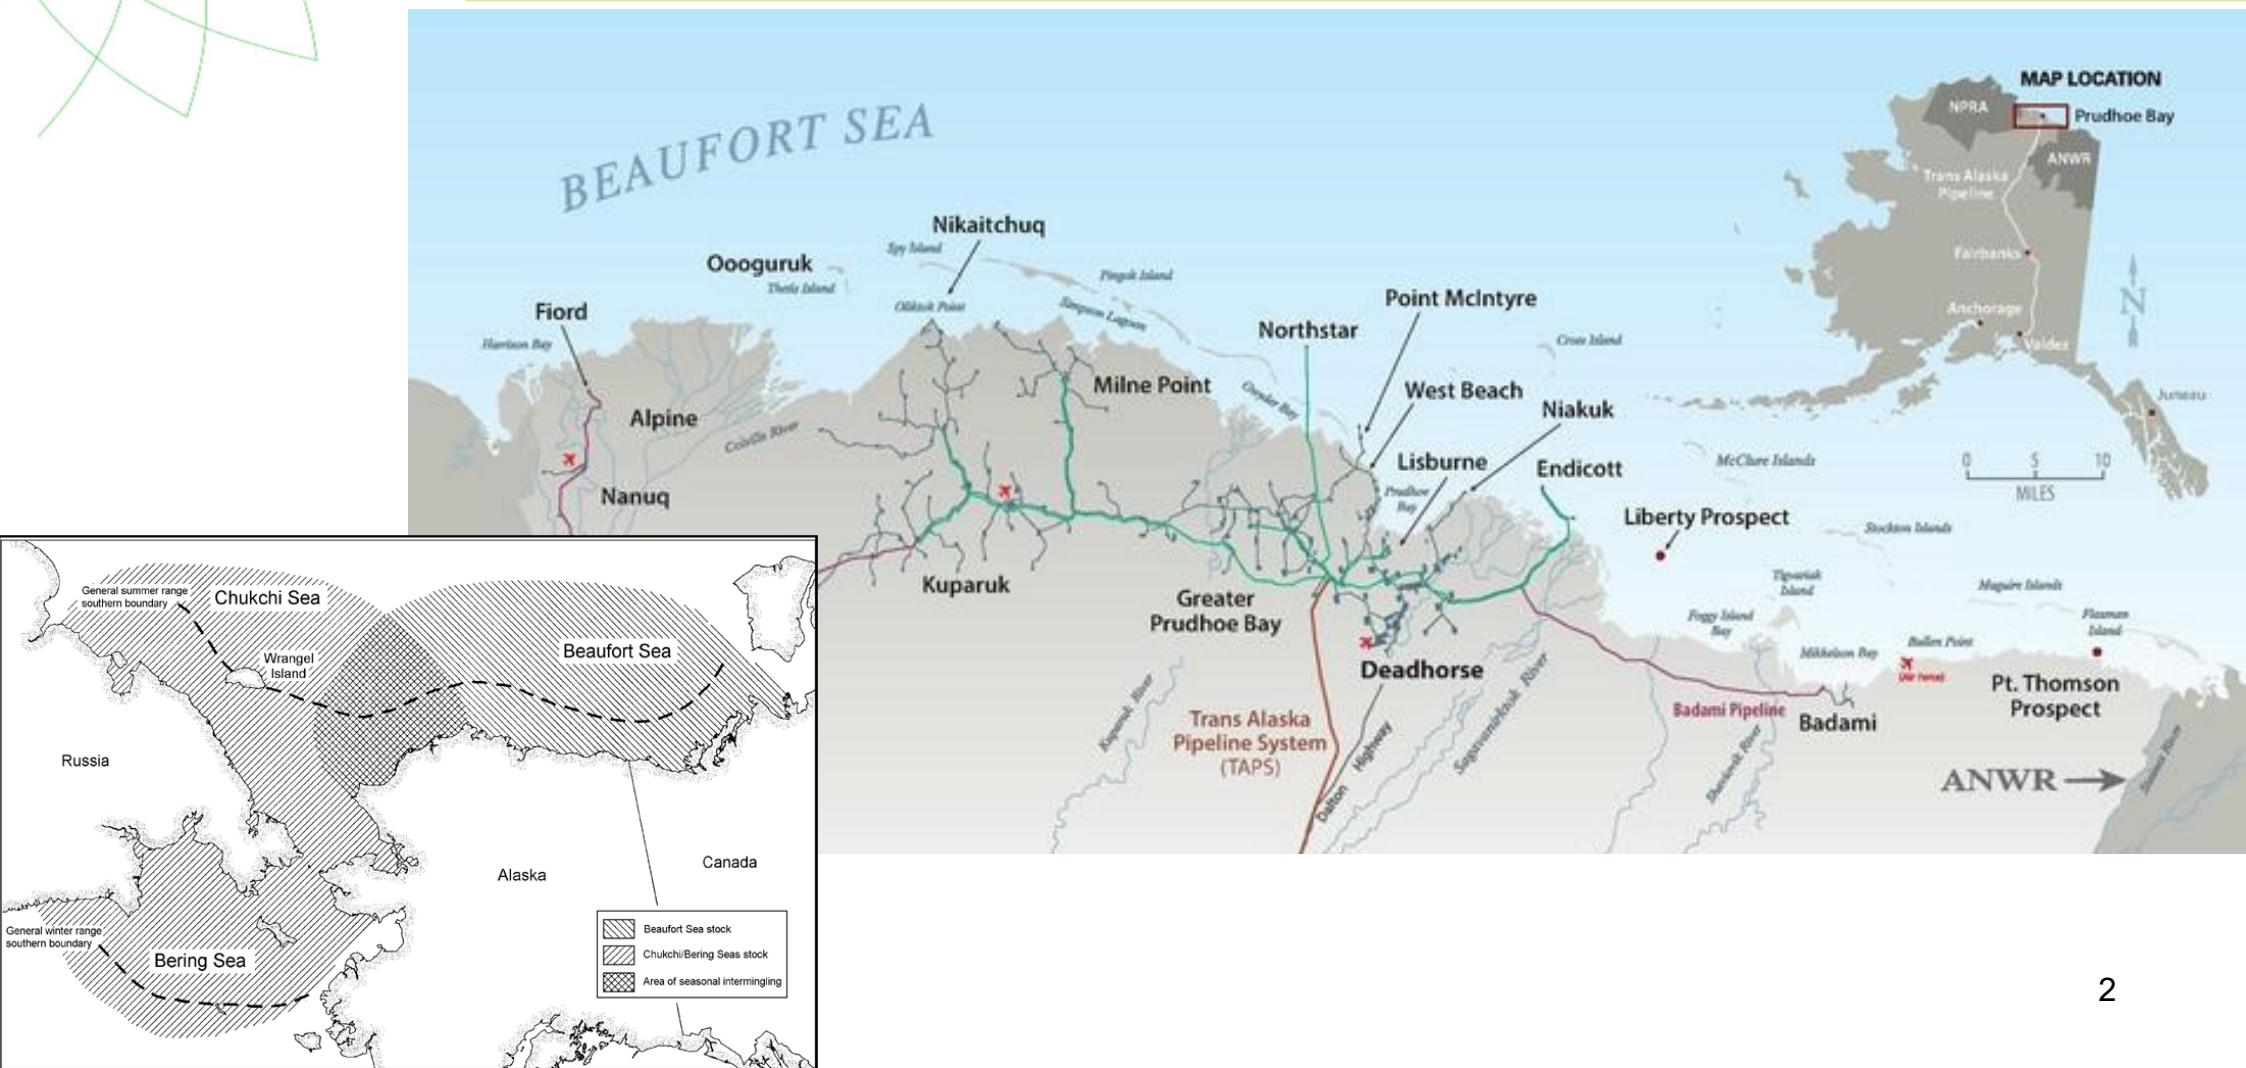

CAFF Arctic Biodiversity Congress (Rovaniemi, Finland)

October 12, 2018

Alaska's North Slope

Alaska's Oilfields

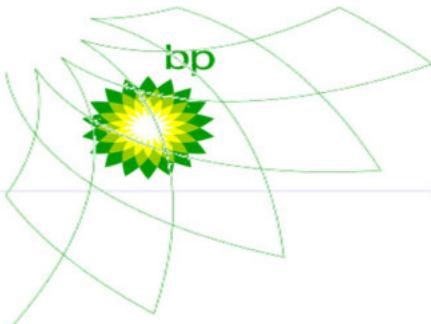

- Beaufort Sea Coast
- Primarily terrestrial oilfields
- Artificial and enhanced islands in shallow and nearshore waters
- BP Alaska operates the Prudhoe Bay Oilfield

Why does an oil company care about bears?

- We have to!
- We have a lot of them
- Worker safety
- Bear safety
- Reputation – Responsible operator
- Fun

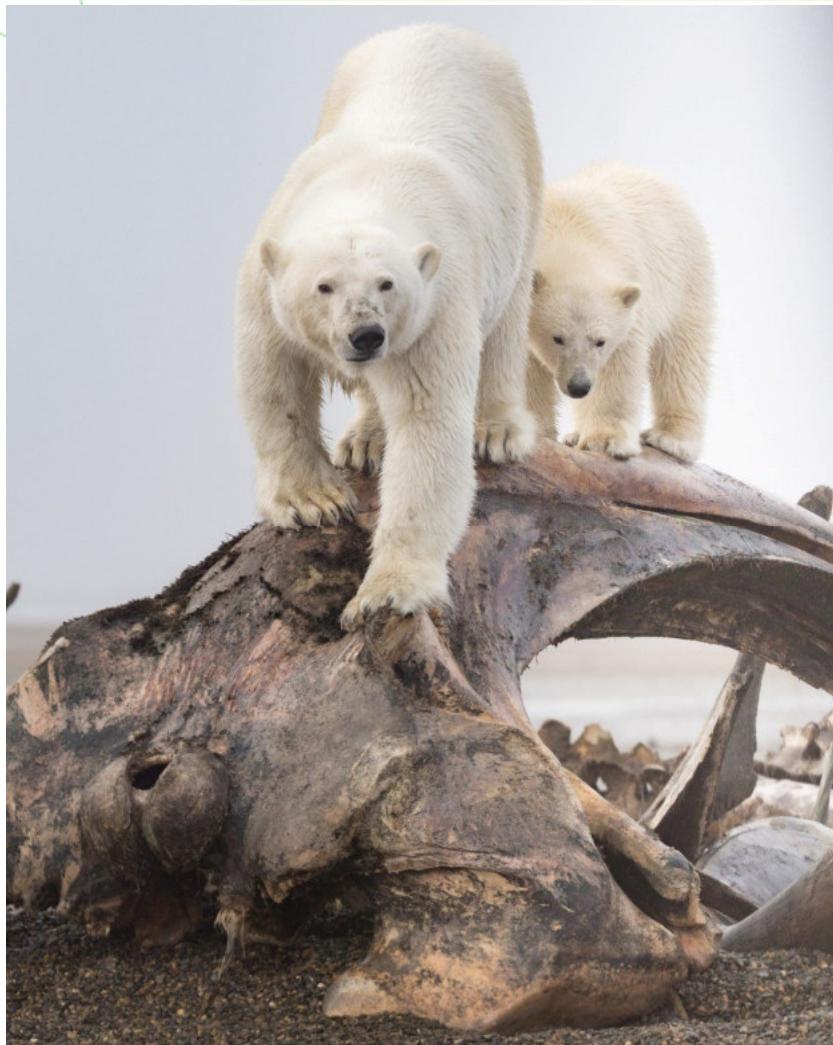

Regulatory Framework

- Incidental Take
- Intentional (Deterrence)
- Extensive set of programmatic requirements:
 - Consultation with subsistence users
 - Detection
 - Mitigation
 - Monitoring
 - Reporting
- Authorizations require Polar Bear Interaction Plans

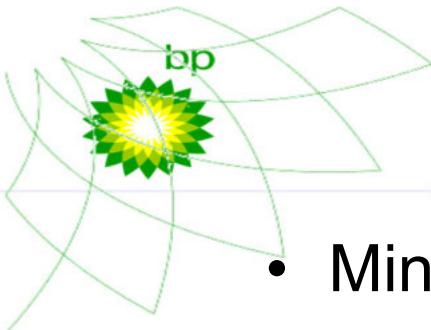

Subsistence Communities

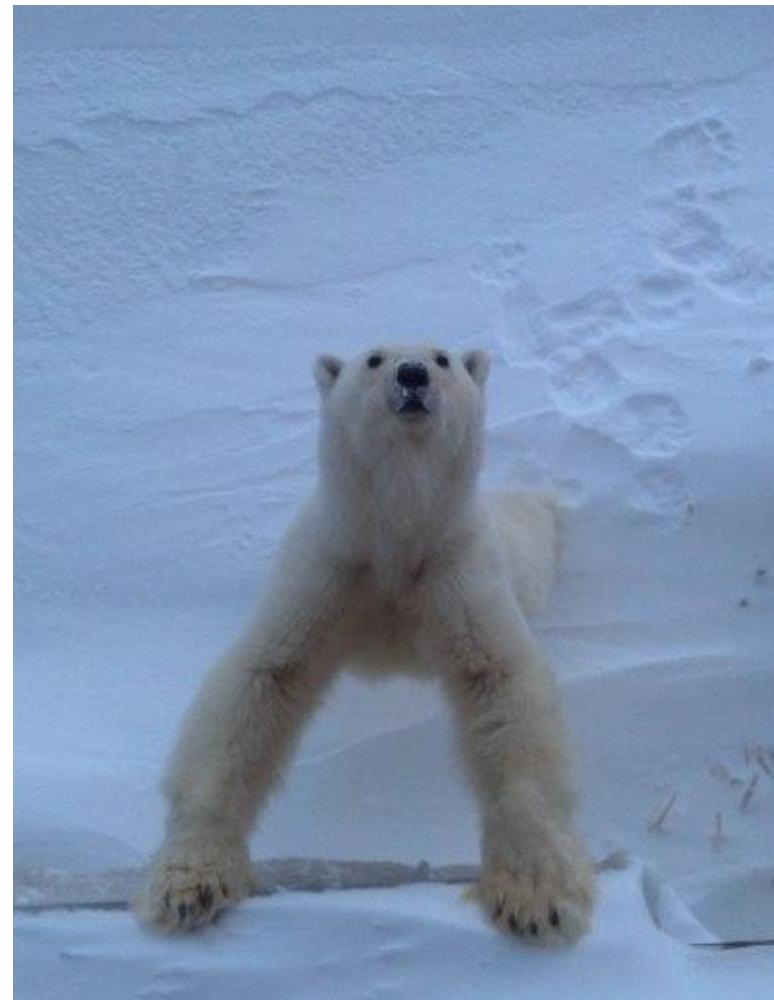

Must minimize adverse impacts on availability of polar bears for subsistence uses

- Consult with subsistence communities to identify potential conflicts
- Develop & implement a Plan of Cooperation with communities
- Benefit from local knowledge
- Guidance: NSB & FWS

Polar Bear Interaction Plans

- Minimize Human-bear conflict
 - Education
 - Training
 - Monitoring/reporting
 - Facilities management
 - Human vs. bear areas
 - Deterrence
 - Protection of dens
- Collaboration is Key!**
- Evolution (30 years)

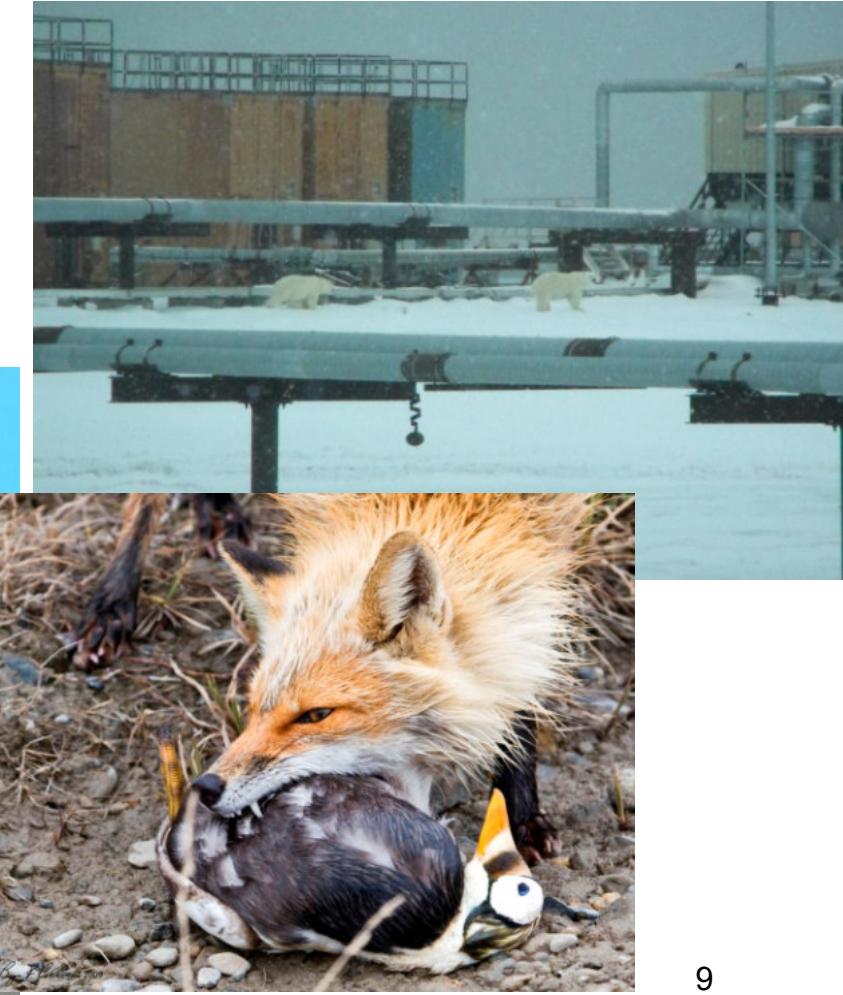

Success

- Bear vs. Human Areas
- High numbers of bears
- Relatively low deterrence activity
- Co-Habitation

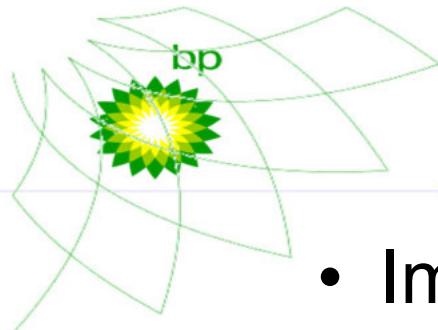

Attractant Management

Den Detection

- Collared bears (need-to-know)
- Annual industry surveys for dens
- Protocols developed by USGS
- Targeted survey areas
- Thermal imaging (FLIR)

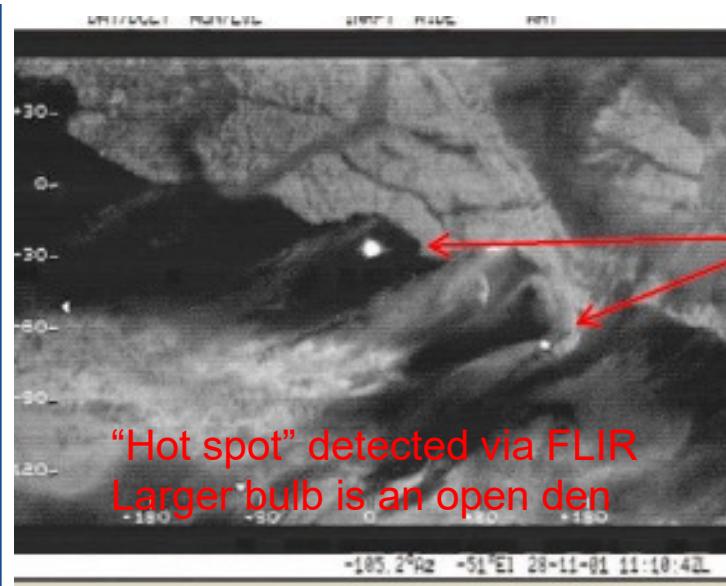

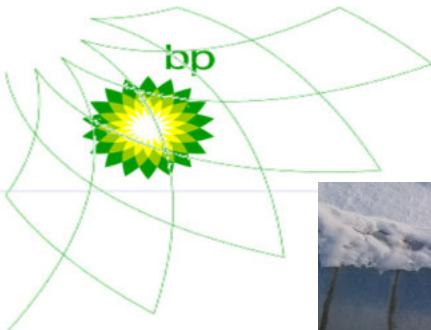

Detecting Dens

- Imagery-based applications
- Forward- Looking Infrared Imagers (FLIR)
- Industry's "go-to" mitigation method
- Detects heat signature on den surface

FLIR imager attached to fixed wing

FLIR Advantages and Challenges

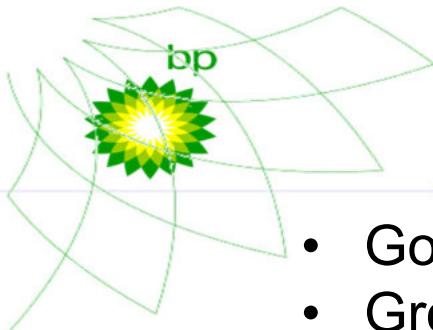

Advantages:

- Detection rates may be 90% in “optimal” conditions
- Flexible platform (airborne, handheld)

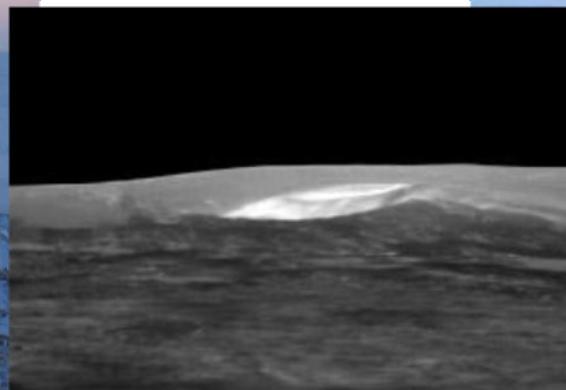

Challenges:

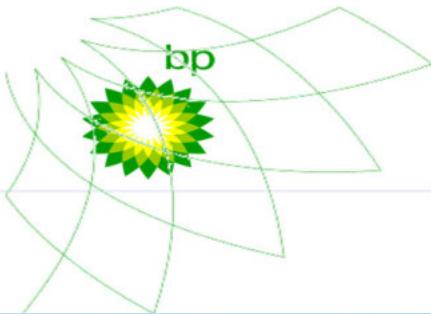

- Sensitive to environmental conditions
 - False negatives & positives
- Weather dependent
- Observer fatigue
- Method only as good as protocol
 - Route selection
 - Timing
 - # of surveys flown
- Bears are good at not being found

Verification of Dens

- Government Personnel
- Ground Truthing:
 - Visual confirmation
 - Trained Service Dogs (Karelian Bear dogs)
 - Handheld thermal detection
- Protocols to avoid disturbance

Verification of Dens – Dogs & Beyond

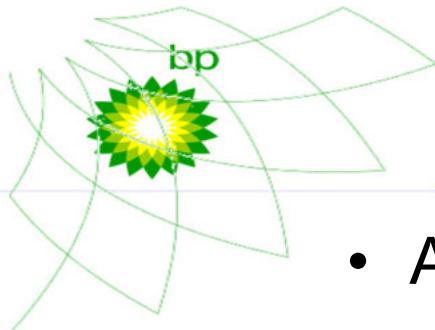

Advantages

- Information
 - FLIR effectiveness
 - Data point
- Den specific mitigation plan (or not!)
- Dogs beat technology
 - No batteries
 - Rarely “false alert”

Challenges:

- Scheduling
- Contracting
- Conditions
- Logistics
- Risk
- Availability

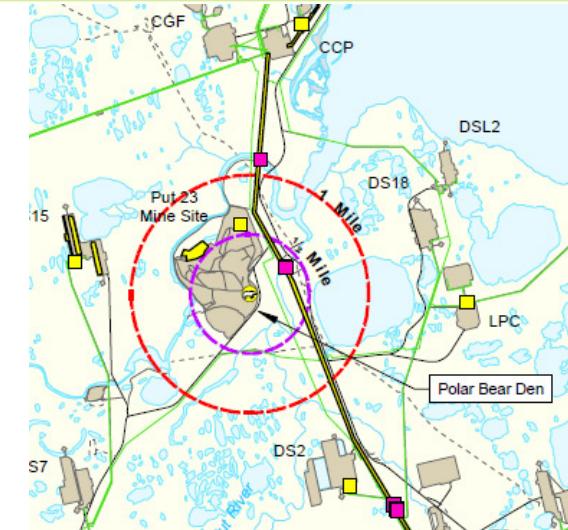

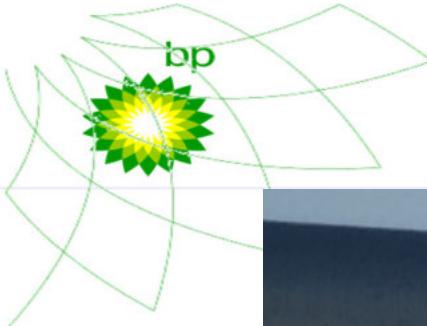

Protection of Dens

- Alter projects as needed
- Activity restrictions within 1-mile of known dens
- No disturbance

In-field dens:

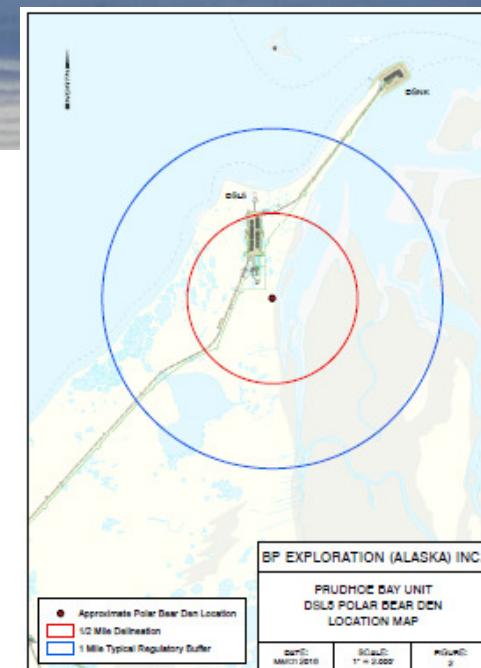

- Den specific management plan
 - Transparency
 - Collaboration
 - Innovation
 - Communication
 - Monitoring
 - Emergence protocols
- Challenges
 - Each den is different
 - Time
 - Monitoring
 - Cost
 - Technology limitations
 - Technology concerns
 - Oil field needs
 - Sharing lessons

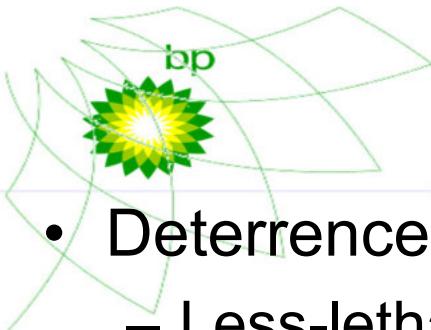

bp

2018 Successful L5 Den Emergence

Innovation – Culture of Improvement

- Deterrence Tactics
 - Less-lethal devices
 - Sight & sound
 - Carbine Pepperball launcher
- Early Detection
 - Ground based radar
- Den Detection & Emergence
 - FLIR, SAR, UAVs
- Den Emergence
 - Research → long term monitoring
 - Direct observation to remote cameras
- PARTNERSHIPS! Govt., Academia, Non-Profits

Looking Forward

- Committed to strong and collaborative partnerships
- Continue to:
 - Be leaders and partners in successful human-bear conflict management
 - Support monitoring, mitigation and studies
 - Share best practices
- Transparency & cooperation with partners in government

A photograph showing four polar bears walking away from the viewer across a dry, brown grassy plain. The bears are in a line, with one slightly behind the others. The background shows a flat horizon with some distant structures.
